

Sharpening the tools: genomics-assisted radiation mutagenesis in winter oilseed rape

Ian Bancroft

16th October, 2023

- **Visualizing genome structural variation in oilseed rape**
- **Trimming the Rfo introgression**
- **A prototype WOSR genome re-sequenced radiation panel**

Visualizing genome dosage variation using genome re-sequencing data

Quantify read depth (RPKM) mapped to
AC genome reference sequence

Display height of histogram bars based on RPKM values

Visualizing genome dosage variation using genome re-sequencing data

Quantify read depth (RPKM) mapped to
AC genome reference sequence

Display height of histogram bars based on RPKM values

Duplication (homoeologous exchange)

Visualizing genome dosage variation using genome re-sequencing data

Quantify read depth (RPKM) mapped to
AC genome reference sequence

Display height of histogram bars based on RPKM values

Duplication (homoeologous exchange)

- Preferable to have a more compact display to compare many genomes

Visualizing genome dosage variation using genome re-sequencing data

Quantify read depth (RPKM) mapped to
AC genome reference sequence

Code intensity of shading based on RPKM values

Filter data for reciprocal top BLAST hit gene pairs

Visualise using tile plots with gene pairs ordered by one genome

Visualizing genome dosage variation using genome re-sequencing data

Positions of 31,591 homoeologous gene pairs, arranged by the order in the C genome of the C genome homoeologue

Reciprocal top
BLAST hit
gene pairs
arranged by
coordinate in
one of the
genomes

- **Gamma and Fast Neutrons induce similar types of variation**
- **Chromosome number variation detected but is independent of radiation dosage**
- **Lesion frequency increases with radiation dosage**
- **More lesions in the C genome than in the A genome**
- **~4-fold more deletions than duplications**

Identification of small-scale lesions induced by radiation

1. Manual inspection of Excel spreadsheets of RPKM data, aided by conditional formatting

- High false discovery rate, especially for SNVs at low read depth
- Mutation load much lower than with EMS
- High proportion of mutants are deletions of a few bases that disrupt reading frames

Testing predictive impacts of gene copy number variation: *FAE1* and oil erucic acid content

FAE1 orthologues control erucic acid content in an additive manner

Identified radiation lines:

G2000-308-1 (*FAE1.A8* deletion)

G1750_2b (*FAE1.A8* duplication)

G1500_6a (*FAE1.C3* deletion)

G2000-119a (*FAE1.C3* duplication)

Testing predictive impacts of gene copy number variation: *FAD2* and oil linoleic acid content

- ***FAD2.A5* Knockout causes large drop in linoleic acid content, as expected**

Adjusted P-values for significance:
** <0.005; *** <0.0005; **** <0.00005

Testing predictive impacts of gene copy number variation: *FAD2* and oil linoleic acid content

Conclusions

- Radiation treatment is an effective tool for breaking up introgressions
- Visualization of whole genome enables identification of additional lesions
- Structural changes correlated with poor agronomic traits can be identified
- Genome re-sequencing enables identification of abundant large-scale deletions
- Panel of ~1100 lines sufficient to achieve saturation for large-scale deletions
- Deleted segments often inherited by siblings, so increasing copy number feasible
- High false discovery rate for single nucleotide variants
- Indels disrupting open reading frames are the most common small variant type
- Panel of ~1100 lines insufficient to achieve saturation for single gene knockout
- Predicted phenotypes confirmed for knockouts of two fatty acid synthesis genes
- Increased *FAE1* dosage results in novel increase in erucic acid content
